Continuation of 5. does NOT place the application in condition for allowance because: Applicant's request for consideration has been considered, but it is not persuasive. Quinn reference teaches the use of a switch assembly in response to elevated temperature by interrupting the charging or discharging state of the battery before the temperature becomes excesive. The teaching of Figure 29 is consistent with those of Figures 22-24 because Figure 29 is a cross-sectional elevational view of the switch assembly of Figures 22-24. Figure 29 shows the use of a sensing swithch (switch element) to send a signal to controller K for cutting off charging current. Specifically Figure 24 shows a closed position in which a short circuit is induced between the 10a (positive electrode) and the housing cap A2, which in turn is in electrical contact with the terminal plate (96). Thus, the 102(e) rejections by Quinn et al. on claims 1-3 are maintained.
